Purpose

Note: Before you start make sure you have completed *Course preparations*. If you haven't go do that now.

The purpose of this assignment is to ensure that you have the tools configured correctly and that you are able to push (upload) your assignment to Bitbucket. You should see the tests passing on your own computer and on Bamboo. You can also see your score in Canvas. The score in Canvas is updated every 30 minutes.

If you need help installing or configuring the tools ask for help on the first lab. The goal for the first week is to get everyone up and running, not necessarily understand everything yet.

Assignment 1.1

This is the first assignment so here are some tips: Computers are dumb. If you make a tiny mistake the tests will not pass. Here are some examples that will fail your assignment:

- Calling the assignment directory *Assignment_1_1* (Uppercase A, not correct)
- Calling the assignment directory *assignment_01_01* (extra zeroes, not correct)
- Calling the assignment directory *assignment_1* (missing *_1*, not correct)
- Outputting *Hello, Christian* (missing exclamation mark)

1. Create the project

Directory name: `assignment_1_1`

- Create a CLion *C Executable* project in *ikt101g23h/assignments/solutions/assignment_1_1*
- The *ikt101g23h/assignments/solutions* directories were created when you completed *Assignment preparations* and should exist already. See that document for details.

2. Code your program

Code a program that prints out *Hello, Christian!* See the lecture example and the first course

example for how to do this.

3. Test locally

see *Local testing with Docker* under *Assignments*.

Test the solution on your own computer. You can fix your code and retest as many times as you want.

4. Deliver and test in Bamboo

See *Delivery and Bamboo testing* under *Assignments*.

Finally deliver and test the solution in Bamboo. This is what updates your score in Canvas which is the score I can see. You can test as many times as you want here as well up until the final deadline.
