Purpose

This week we will start learning more about the C programming language. CLion, Docker and Git should be installed and working from last week, so the focus is to start programming in CLion. Testing and delivery is the same as last week and every week going forward.

This assignment requires knowledge from both lecture 3 and 4, so you might want to work on lecture 3, wait for lecture 4 then do this assignment.

Assignment 2.1

1. Create the project

Directory name: assignment_2_1

Create a CLion-project inside the `ikt101g23h/assignments/solutions/assignment_2_1` directory. The `ikt101g23h/assignments/solutions` directories were created when you completed *Assignment preparations*. See that document for details.

2. Code your program

Write a program that asks the user for numbers (floats) until 0 is given, then (*The numbers here are just an example*):

- Prints out how many numbers have been given (excluding the 0):
Count: 5
- Prints out the sum of all the numbers:
Sum: 78
- Prints out the average:
Average: 15.6

Tip: Use `%g` with `printf` when displaying sum and average so that rounding matches my tests.

Tip 2: You do not need to use arrays for this assignment. That'll be for assignment 3.

Note that the output must be written exactly as stated (with the calculated numbers of course). Missing space, lowercase “sum” etc will fail the tests as usual.

3. Test locally

see *Local testing with Docker* under *Assignments*.

Test the solution on your own computer. You can fix your code and retest as many times as you want.

4. Deliver and test in Bamboo

See *Delivery and Bamboo testing* under *Assignments*.

Finally deliver and test the solution in Bamboo. This is what updates your score in Canvas which is the score I can see. You can test as many times as you want here as well up until the final deadline.
