▼ Detaljer

5.1

Folder name: ikt101g23h/assignments/solutions/assignment_5_1

Specification: Write an application that asks the user for the following student information (in this order):

- Student id
Example: 3872187
- Name
Example: John Doe
- Age
Example: 21

Then prints the information back to the user.

Requirements:

The student information must be stored and retrieved in a structure with a typedef called *student_t*.

Expected output (with the values that were entered):

Student id: 3872187

Name: John Doe

Age: 21

5.2

Folder name: ikt101g23h/assignments/solutions/assignment_5_2

Specification: Reuse the code you made in 5.1 (if you want), then modify it so that:

The application prints a menu with the following choices:

1. Read student information from file
2. Write student information to file

3. Exit

The user (and my tests) types 1, then 3 (for example).

Choice 1 does:

1. Opens the file `student_read.txt` (it already exists on Bamboo)
2. Reads in each of the lines
3. Prints the information using the format from 5.1

Choice 2 does:

1. Asks the user for the student information (like 5.1)
2. Writes that information to the `student_write.txt` file, example below

Choice 3 exits the program

Requirements:

The format of the text file must look like this:

```
3872187
John Doe
21
```

3. Test locally

see *Local testing with Docker* under Assignments.

Test the solution on your own computer. You can fix your code and retest as many times as you want.

4. Deliver and test in Bamboo

See *Delivery and Bamboo testing* under Assignments.

Finally deliver and test the solution in Bamboo. This is what updates your score in Canvas which is the score I can see. You can test as many times as you want here as well up until the final deadline.
