▼ Detaljer

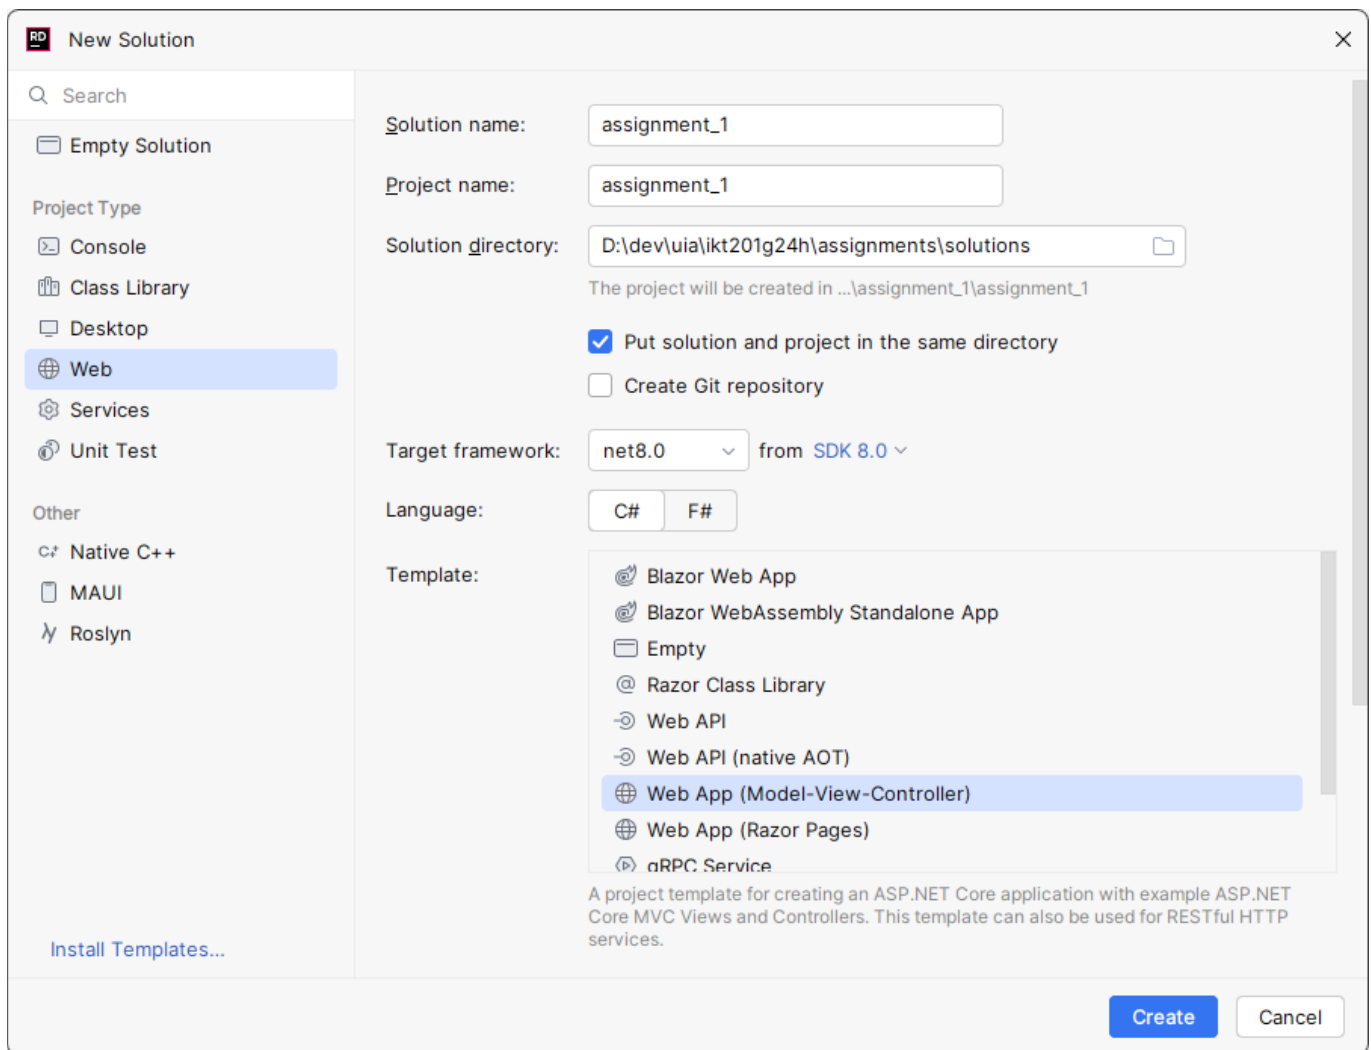

1. Preparations

Complete *Course preparations* under **Moduler** (<https://uia.instructure.com/courses/16342/modules>) before starting on this assignment. This must be done first.

2. Create project

Open Rider and create a new ASP.NET Core Web application inside your *ikt201g24h/assignments/solutions* directory. The *ikt201g24h* directory was created in your home directory during *Course preparations*. You will need to change the following:

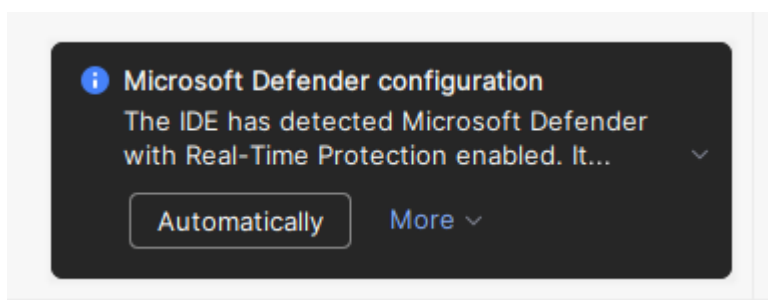

- Solution name (which updates Project name automatically)
- Solution directory
- Enable *Put solution and project in the same directory*

When you open a project for the first time there are two things you should do in Rider:

1. Accept the antivirus exclusion

This adds the project to the antivirus exclusion list, which prevents it from being scanned. This both speeds up compiling, and prevents the antivirus from blocking unknown files.

2. Set the run mode to http

There's a dropdown with multiple ways of running the project at the top of the Rider UI. Set this to http or https. The default does not work without additional software.

3. Assignment

In this assignment you will create a web page about yourself or something you are interested in using HTML and CSS. The learning goals are to learn some basic HTML (if you don't already know it) and to understand the directory structure of an ASP.NET MVC project.

What you decide to share is up to you, but here are some suggestions:

- Why you chose the education you are currently pursuing
- What you wish to get out of this course
- Any ideas you might have for the project (crazy or not)
- If you wish to share something a bit more personal: Hobbies or interests.

Requirements

Setup

1. Create a new controller named AboutController
2. Create an Index.cshtml view for this controller

Use the new *Views/About/Index.cshtml* file to write your assignment.

The purpose of the assignment is to get started on HTML, CSS and Bootstrap. The page must:

1. have a layout defined using the front-end framework 'bootstrap' with at least 2 columns
2. Use the following HTML tags in some way:
div, p, h2, h3, em, strong
3. have an HTML ordered list with items
4. have an HTML unordered list with items
5. have a HTML table styled using Bootstrap CSS classes
6. have a Bootstrap styled search box with a submit button that posts an HTML form.

This search box must be inside a form.

(doesn't do anything yet, we'll get to that later)

7. have picture of yourself (e.g. student photo) or a hobby of yours
8. use an external CSS style sheet in *wwwroot/css/custom.css* with a minimum of:
 1. A custom style tied to an id
 2. A custom style tied to a class

Note: You must add a reference to the new CSS file in *Views/Shared/_Layout.cshtml*, under the existing references.

9. use the custom styles in your page

4. Testing and delivery

See *Local testing* and *Delivery and Bamboo testing* under *Assignments*.
